Introduction

Sector-decomposition

New phase space construction

't Hooft-Veltman scheme

C++ implementation of STRIPPER

Summary

Predictions from higher order perturbation theory

Ultimate Goal: describe measurements for high energy collisions

- Model \rightarrow QFT
- predictions \rightarrow perturbation theory
- (simplified) idea: higher orders \rightarrow better predictions
- higher order introduce UV and IR divergences
 - need for regularization (dimensional regularization, mass,...) and renormalization (introduction of additional scale μ)
 - methods of handling IR divergences

\Rightarrow increasing complexity of calculations

The Les Houches wishlist

List of process of phenomenological interest

process	NLO	NNLO	N ³ LO

$pp \rightarrow 2j$	✓	✓	
$pp \rightarrow 3j$	✓	!	
...			

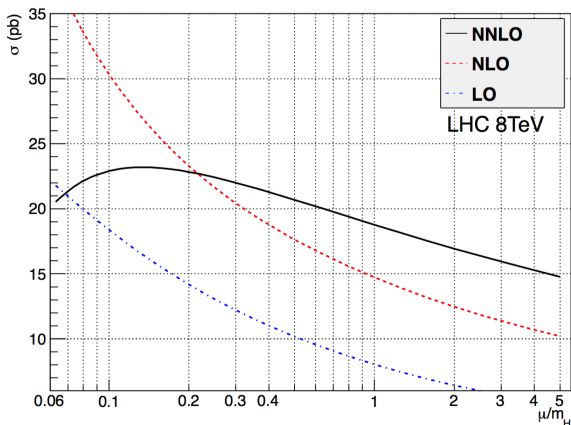

Is it worth the effort....?

Fixed Order QCD

- Slow convergence up to next-to-next-to-leading order
- Additional drawback: Effective Field Theory description
- Till recently:

	σ [8 TeV]	$\delta\sigma$ [%]
LO	9.6 pb	$\sim 25\%$
NLO	16.7 pb	$\sim 20\%$
NNLO	19.6 pb	$\sim 7 - 9\%$
N3LO	???	$\sim 4 - 8\%$

Duhr ICHEP '14

Fixed Order QCD

- The greatest achievement of last year in the field: N^3LO

*Claude Duhr, Falko Dulat, Elisabetta Furlan, Thomas Gehrmann,
Franz Herzog, Achilleas Lazopoulos, Bernhard Mistlberger '14 - '16*

Triple virtual

Real-virtual
squared

Double virtual
real

Double real
virtual

Triple real

- First hadron collider process at this precision

Fixed Order QCD

- **The greatest achievement of last year in the field: N³LO**

*Claude Duhr, Falko Dulat, Elisabetta Furlan, Thomas Gehrmann,
Franz Herzog, Achilleas Lazopoulos, Bernhard Mistlberger '14 - '16*

Ludicrous complexity

- Two orders of magnitude more Feynman diagrams than NNLO
- 1028 N³LO master integrals (27 at NNLO)
- 72 boundary conditions for the N³LO master integrals (5 at NNLO)

- **First hadron collider process at this precision**

Fixed Order QCD

- **The greatest achievement of last year in the field: N³LO**

*Claude Duhr, Falko Dulat, Elisabetta Furlan, Thomas Gehrmann,
Franz Herzog, Achilleas Lazopoulos, Bernhard Mistlberger '14 - '16*

$$\sigma^{NNLO} = 47.02 \text{ pb} \begin{matrix} +5.13 \text{ pb (10.9\%)} \\ -5.17 \text{ pb (11.0\%)} \end{matrix} (\text{theory}) \begin{matrix} +1.48 \text{ pb (3.14\%)} \\ -1.46 \text{ pb (3.11\%)} \end{matrix} (\text{PDF} + \alpha_s)$$

After the calculation

$$\sigma = 48.58 \text{ pb} \begin{matrix} +2.22 \text{ pb (+4.56\%)} \\ -3.27 \text{ pb (-6.72\%)} \end{matrix} (\text{theory}) \pm 1.56 \text{ pb (3.20\%)} (\text{PDF} + \alpha_s)$$

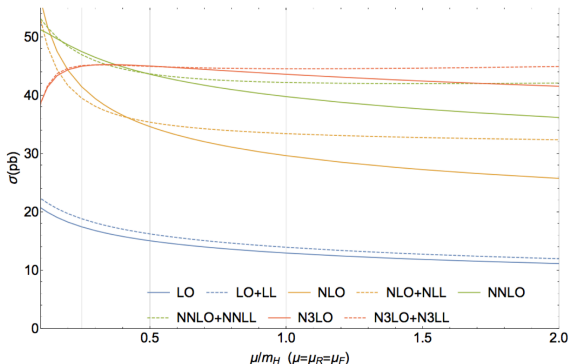

- **First hadron collider process at this precision**

Fixed Order QCD

- The greatest achievement of last year in the field: N^3LO

*Claude Duhr, Falko Dulat, Elisabetta Furlan, Thomas Gehrmann,
Franz Herzog, Achilleas Lazopoulos, Bernhard Mistlberger '14 - '16*

Excellent stability of
the predictions -
almost negligible
resummation effects

- First hadron collider process at this precision

- any process at colliders is specified by final states, and cuts on these final states
- parton-hadron duality is used, but partons being massless can be emitted at will
- it is necessary to sum (incoherently) over processes with a different number of final partons

- exchange or emission of partons lead to divergences

Kinoshita-Lee-Nauenberg theorem

- the theorem states that for “suitably averaged” transition probabilities (cross sections), the result is finite
- particular case is given by electron-positron annihilation

- the different contributions are **divergent**, but the self energy itself is finite, and the total cross section is just its imaginary part
- the averaging is obtained by integrating the cross section with a “**jet function**” F_J , depending on the momenta of the partons (or mesons and hadrons)
- F_J is required to be “**infrared safe**”, i.e. the value for a soft or collinear degenerate configuration of $n+1$ partons is the same as the value for the equivalent n partons

- unfortunately, in hadronic collisions, the initial states are not properly averaged
- instead, a **factorization theorem** is used, e.g. for top quark pair production

$$\sigma_{h_1 h_2 \rightarrow t \bar{t}}(s, m_t^2) = \sum_{ij} \int_0^1 \int_0^1 dx_1 dx_2$$

$$\phi_{i/h_1}(x_1, \mu_F^2) \phi_{j/h_2}(x_2, \mu_F^2) \hat{\sigma}_{ij}(\hat{s}, m_t^2, \alpha_s(\mu_R^2), \mu_R^2, \mu_F^2)$$

Parton Distribution Functions

Renormalization scale

Factorization scale

- the divergences of **the initial state collinear radiation** are absorbed into the (universal) **parton distribution functions**
- the general formula is

$$[\sigma_{ij}(x)/x] = \sum [\hat{\sigma}_{kl}(z)/z] \otimes \Gamma_{ki} \otimes \Gamma_{lj} \left[f_1 \otimes f_2 \right](x) = \int_0^1 dx_1 dx_2 f_1(x_1) f_2(x_2) \delta(x - x_1 x_2)$$

$$\Gamma_{ij} = \delta_{ij} \delta(1-x) - \frac{\alpha_s}{\pi} \frac{P_{ij}^{(0)}(x)}{\epsilon} + \left(\frac{\alpha_s}{\pi} \right)^2 \left[\frac{1}{2\epsilon^2} \left((P_{ik}^{(0)} \otimes P_{kj}^{(0)})(x) + \beta_0 P_{ij}^{(0)}(x) \right) - \frac{1}{2\epsilon} P_{ij}^{(1)}(x) \right] + \mathcal{O}(\alpha_s^3)$$
- Consistency of the construction requires a **consistent dimensional regularization**

The general idea of subtraction

- add to the original cross section

$$\sigma = \sigma^{LO} + \sigma^{NLO}$$

$$\sigma^{LO} = \int_m d\sigma^B, \quad \sigma^{NLO} \equiv \int d\sigma^{NLO} = \int_{m+1} d\sigma^R + \int_m d\sigma^V$$

an identity involving approximations to the real radiation cross section

$$\sigma^{NLO} = \int_{m+1} [d\sigma^R - d\sigma^A] + \int_{m+1} d\sigma^A + \int_m d\sigma^V$$

and regroup the terms as

$$\sigma^{NLO} = \int_{m+1} [(d\sigma^R)_{\epsilon=0} - (d\sigma^A)_{\epsilon=0}] + \int_m [d\sigma^V + \int_1 d\sigma^A]_{\epsilon=0}$$

- for $d\sigma^A$ it must be possible to
 1. obtain the Laurent expansion by integration over the single particle unresolved space (preferably analytically)
 2. approximate $d\sigma^R$ (preferably pointwise)

Subtraction at NLO (and beyond?)

NLO Subtraction Schemes

- Dipole Subt. [Catani,Seymour'98]
- FKS [Frixione,Kunst,Signer'95]
- Antenna Subtraction [Kosower'97]
- Nagy-Soper [Nagy,Soper'07]

Generalization to NNLO?

- Nature of singularities known: soft and collinear limits
- NLO (fairly simple):
 - single soft
 - single collinear
- At NNLO? : Many (overlapping) ways to reach soft and collinear limits
- Possible way: Decomposition of the phase space to disentangle them

NNLO subtraction schemes

Handling real radiation contribution in NNLO calculations cancellation of infrared divergences

increasing number of available NNLO calculations with a variety of schemes

- **qT-slicing** [Catani,Grazzini, '07] , [Ferrera,Grazzini,Tramontano, '11], [Catani,Cieri,DeFlorian,Ferrera,Grazzini,'12], [Gehrmann,Grazzini,Kallweit,Maierhofer,Manteuffel,Rathlev,Torre,'14-'15'], [Bonciani,Catani,Grazzini,Sargsyan,Torre,'14-'15]

Sector-decomposition

Formulation

Hadronic cross section:

$$\sigma_{h_1 h_2}(P_1, P_2) = \sum \int \int_0^1 dx_1 dx_2 f_{a/h_1}(x_1, \mu_F^2) f_{b/h_2}(x_2, \mu_F^2) \hat{\sigma}_{ab}(x_1 P_1, x_2 P_2; \alpha_S(\mu_R^2), \mu_R^2, \mu_F^2)$$

partonic cross section:

$$\hat{\sigma}_{ab} = \hat{\sigma}_{ab}^{(0)} + \hat{\sigma}_{ab}^{(1)} + \hat{\sigma}_{ab}^{(2)} + \mathcal{O}(\alpha_S^3)$$

Contributions with different final state multiplicities and convolutions:

$$\hat{\sigma}_{ab}^{(2)} = \hat{\sigma}_{ab}^{\text{RR}} + \hat{\sigma}_{ab}^{\text{RV}} + \hat{\sigma}_{ab}^{\text{VV}} + \hat{\sigma}_{ab}^{\text{C2}} + \hat{\sigma}_{ab}^{\text{C1}}$$

$$\hat{\sigma}_{ab}^{\text{RR}} = \frac{1}{2\hat{s}} \int d\Phi_{n+2} \langle \mathcal{M}_{n+2}^{(0)} | \mathcal{M}_{n+2}^{(0)} \rangle F_{n+2}$$

$$\hat{\sigma}_{ab}^{\text{RV}} = \frac{1}{2\hat{s}} \int d\Phi_{n+1} 2\text{Re} \langle \mathcal{M}_{n+1}^{(0)} | \mathcal{M}_{n+1}^{(1)} \rangle F_{n+1}$$

$$\hat{\sigma}_{ab}^{\text{VV}} = \frac{1}{2\hat{s}} \int d\Phi_n \left(2\text{Re} \langle \mathcal{M}_n^{(0)} | \mathcal{M}_n^{(2)} \rangle + \langle \mathcal{M}_n^{(1)} | \mathcal{M}_n^{(1)} \rangle \right) F_n$$

$$\hat{\sigma}_{ab}^{\text{C1}} = (\text{single convolution}) F_{n+1}$$

$$\hat{\sigma}_{ab}^{\text{C2}} = (\text{double convolution}) F_n$$

Sector decomposition

Several layers of decomposition

Selector functions:

$$1 = \sum_{i,j} \left[\sum_k \mathcal{S}_{ij,k} + \sum_{k,l} \mathcal{S}_{i,k;j,l} \right]$$

Factorization of double soft limits:

$$\theta(u_1^0 - u_2^0) + \theta(u_2^0 - u_1^0)$$

Sector parameterization

Parameterization with respect to the reference parton r :

angles: $\hat{\eta}_i = \frac{1}{2}(1 - \cos \theta_{ir}) \in [0, 1]$

energies: $\hat{\xi}_i = \frac{u_i^0}{u_{\max}^0} \in [0, 1]$

originally: 5 sub-sectors

Triple collinear factorization

Sector decomposition

Several layers of decomposition

Selector functions:

$$1 = \sum_{i,j} \left[\sum_k \mathcal{S}_{ij,k} + \sum_{k,l} \mathcal{S}_{i,k;j,l} \right]$$

Factorization of double soft limits:

$$\theta(u_1^0 - u_2^0) + \theta(u_2^0 - u_1^0)$$

Sector parameterization

Parameterization with respect to the reference parton r :

angles: $\hat{\eta}_i = \frac{1}{2}(1 - \cos \theta_{ir}) \in [0, 1]$

energies: $\hat{\xi}_i = \frac{u_i^0}{u_{\max}^0} \in [0, 1]$

now: 4 sub-sectors

Triple collinear factorization

Caola, Melnikov, Röntsch [hep-ph:1702.01352v1]

STRIPPER

$$\hat{\sigma}_{ab}^{RR} = \frac{1}{2\hat{s}} \int d\Phi_{n+2} \langle \mathcal{M}_{n+2}^{(0)} | \mathcal{M}_{n+2}^{(0)} \rangle F_{n+2}$$

$$\hat{\sigma}_{ab}^{C1} = (\text{single convolution}) F_{n+1}$$

$$\hat{\sigma}_{ab}^{RV} = \frac{1}{2\hat{s}} \int d\Phi_{n+1} 2\text{Re} \langle \mathcal{M}_{n+1}^{(0)} | \mathcal{M}_{n+1}^{(1)} \rangle F_{n+1}$$

$$\hat{\sigma}_{ab}^{C2} = (\text{double convolution}) F_n$$

$$\hat{\sigma}_{ab}^{VV} = \frac{1}{2\hat{s}} \int d\Phi_n \left(2\text{Re} \langle \mathcal{M}_n^{(0)} | \mathcal{M}_n^{(2)} \rangle + \langle \mathcal{M}_n^{(1)} | \mathcal{M}_n^{(1)} \rangle \right) F_n$$

Sector decomposition and master formula:

$$x^{-1-b\epsilon} = \underbrace{\frac{-1}{b\epsilon}}_{\text{pole term}} + \underbrace{\left[x^{-1-b\epsilon} \right]_+}_{\text{reg. + sub.}}$$

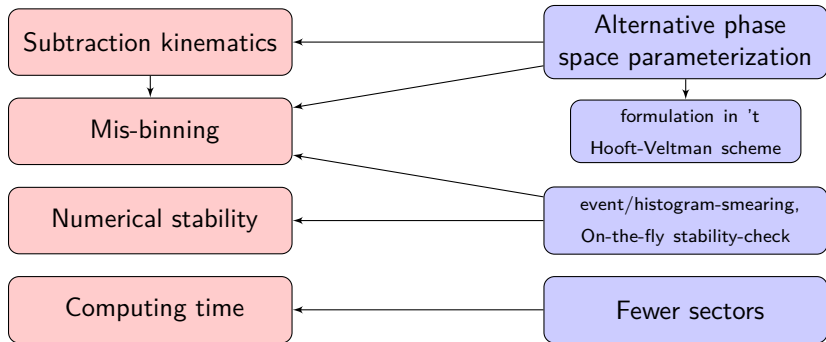

$$\left(\sigma_F^{RR}, \sigma_{SU}^{RR}, \sigma_{DU}^{RR} \right) \quad \left(\sigma_F^{RV}, \sigma_{SU}^{RV}, \sigma_{DU}^{RV} \right) \quad \left(\sigma_F^{VV}, \sigma_{DU}^{VV}, \sigma_{FR}^{VV} \right) \quad \left(\sigma_{SU}^{C1}, \sigma_{DU}^{C1} \right) \quad \left(\sigma_{DU}^{C2}, \sigma_{FR}^{C2} \right)$$

⇓ 4 dim formulation [Czakon,Heymes'14]

$$\left(\sigma_F^{RR} \right) \quad \left(\sigma_F^{RV} \right) \quad \left(\sigma_{DU}^{VV} \right) \quad \left(\sigma_{SU}^{RR}, \sigma_{SU}^{RV}, \sigma_{SU}^{C1} \right) \quad \left(\sigma_{DU}^{RR}, \sigma_{DU}^{RV}, \sigma_{DU}^{VV}, \sigma_{DU}^{C1}, \sigma_{DU}^{C2} \right) \quad \left(\sigma_{FR}^{RV}, \sigma_{FR}^{VV}, \sigma_{FR}^{C2} \right)$$

How to improve the STRIPPER subtraction scheme?

Motto

Optimizing by minimizing

New phase space construction: Idea

Goal

Phase space construction with a minimal # of subtraction kinematics

Old construction

- Start with unresolved partons
 - Fill remaining phase space with Born configuration
- Non-minimal # kinematic configurations
(e.g. single soft and collinear limits yield different configurations)

New construction

- Start with Born configuration
- Add unresolved partons (u_i)
- Cleverly adjust Born configuration to accommodate the u_i

New phase space construction

Mapping from $n + 2$ to Born configuration: $\{P, r_j, u_k\} \rightarrow \{\tilde{P}, \tilde{r}_j\}$
modification of [Frixione,Webber'02] or [Frixione,Nason,Oleari'07]

Requirements:

- Keep direction of reference r fixed
- Invertible for fixed u_j :
 $\{\tilde{P}, \tilde{r}_j, u_k\} \rightarrow \{P, r_j, u_k\}$
- Preserve $q^2 = \tilde{q}^2$, $\tilde{q} = \tilde{P} - \sum_{j=1}^{n_{fr}} \tilde{r}_j$

Main steps:

- Generate Born phase space configuration

New phase space construction

Mapping from $n + 2$ to Born configuration: $\{P, r_j, u_k\} \rightarrow \{\tilde{P}, \tilde{r}_j\}$
modification of [Frixione,Webber'02] or [Frixione,Nason,Oleari'07]

Requirements:

- Keep direction of reference r fixed
- Invertible for fixed u_i :
 $\{\tilde{P}, \tilde{r}_j, u_k\} \rightarrow \{P, r_j, u_k\}$
- Preserve $q^2 = \tilde{q}^2$, $\tilde{q} = \tilde{P} - \sum_{j=1}^{n_{fr}} \tilde{r}_j$

Main steps:

- Generate Born phase space configuration
- Generate unresolved partons u_i

New phase space construction

Mapping from $n + 2$ to Born configuration: $\{P, r_j, u_k\} \rightarrow \{\tilde{P}, \tilde{r}_j\}$
modification of [Frixione,Webber'02] or [Frixione,Nason,Oleari'07]

Requirements:

- Keep direction of reference r fixed
- Invertible for fixed u_i :
 $\{\tilde{P}, \tilde{r}_j, u_k\} \rightarrow \{P, r_j, u_k\}$
- Preserve $q^2 = \tilde{q}^2$, $\tilde{q} = \tilde{P} - \sum_{j=1}^{n_{fr}} \tilde{r}_j$

Main steps:

- Generate Born phase space configuration
- Generate unresolved partons u_i
- Rescale reference momentum

New phase space construction

Mapping from $n + 2$ to Born configuration: $\{P, r_j, u_k\} \rightarrow \{\tilde{P}, \tilde{r}_j\}$
modification of [Frixione,Webber'02] or [Frixione,Nason,Oleari'07]

Requirements:

- Keep direction of reference r fixed
- Invertible for fixed u_i :
 $\{\tilde{P}, \tilde{r}_j, u_k\} \rightarrow \{P, r_j, u_k\}$
- Preserve $q^2 = \tilde{q}^2$, $\tilde{q} = \tilde{P} - \sum_{j=1}^{n_{fr}} \tilde{r}_j$

Main steps:

- Generate Born phase space configuration
- Generate unresolved partons u_i
- Rescale reference momentum
- Boost non-reference momenta of the Born configuration

Behaviour in singular limits

Collinear limit of u_2

(sector 1, $\eta_2 \rightarrow 0$)

Soft limit of u_2

(sector 1, $\xi_2 \rightarrow 0$)

→ Both singular limits approach the same kinematic configuration

Behaviour in singular limits

(sector 1, $\eta_1 \rightarrow 0$)

Double soft limit of u_1 & u_2

(sector 1, $\xi_1 \rightarrow 0$)

→ Both double unresolved limits approach the Born configuration

Behaviour in singular limits

Triple collinear limit of u_1 & u_2

(sector 1, $\eta_1 \rightarrow 0$)

Double soft limit of u_1 & u_2

(sector 1, $\xi_1 \rightarrow 0$)

→ Both double unresolved limits approach the Born configuration

Consequences

Features

- Minimal number of subtraction kinematics
- Only one DU configuration
→ pole cancellation for each Born phase space point
- Expected improved convergence of invariant mass distributions, since $\tilde{q}^2 = q^2$

Unintentional features

- Construction in lab frame
- Original construction of 't Hooft Veltman corrections [Czakon,Heymes'14] is spoiled

't Hooft-Veltman scheme

Separately finite contributions

Finite parts:

$$\sigma_F^{RR}$$

$$\sigma_F^{RV}$$

$$\sigma_F^{VV}$$

Finite remainder parts:

$$\sigma_{FR}^{RV}, \sigma_{FR}^{VV}, \sigma_{FR}^{C2}$$

Single (SU) and double (DU) unresolved parts:

$$\sigma_{SU}^{RR}, \sigma_{SU}^{RV}, \sigma_{SU}^{C1}$$

$$\sigma_{DU}^{RR}, \sigma_{DU}^{RV}, \sigma_{DU}^{C1}, \sigma_{DU}^{VV}, \sigma_{DU}^{C2}$$

$$\sigma_{SU}^{RR}, \sigma_{SU}^{RV}, \sigma_{SU}^{C1}$$

$$\sigma_{DU}^{RR}, \sigma_{DU}^{RV}, \sigma_{DU}^{C1}, \sigma_{DU}^{VV}, \sigma_{DU}^{C2}$$

The measurement function

Observables: Implemented by infrared safe measurement function (MF) F_m

Infrared property in STRIPPER context:

- $\{x_i\} \rightarrow 0 \leftrightarrow$ single unresolved limit
 $\Rightarrow F_{n+2} \rightarrow F_{n+1}$
- $\{x_i\} \rightarrow 0 \leftrightarrow$ double unresolved limit
 $\Rightarrow F_{n+2} \rightarrow F_n$
 $\Rightarrow F_{n+1} \rightarrow F_n$

Tool for new formulation in the 't Hooft Veltman scheme:

Parameterized MF F_{n+1}^α

- $F_n^\alpha \equiv 0$ for $\alpha \neq 0$
(NLO MF)
- 'arbitrary' F_n^0
(NNLO MF)
- $\alpha \neq 0 \Rightarrow$ DU = 0 and SU separately finite

Example: $F_{n+1}^\alpha = F_{n+1} \Theta_\alpha(\{\alpha_i\})$
with $\Theta_\alpha = 0$ if some $\alpha_i < \alpha$

The single unresolved (SU) contribution

$$\sigma_{SU} = \sigma_{SU}^{RR} + \sigma_{SU}^{RV} + \sigma_{SU}^{C1} \quad \text{where} \quad \sigma_{SU}^c = \int d\Phi_{n+1} (I_{n+1}^c F_{n+1} + I_n^c F_n)$$

NLO measurement function ($\alpha \neq 0$):

$$\int d\Phi_{n+1} (I_{n+1}^{RR} + I_{n+1}^{RV} + I_{n+1}^{C1}) F_{n+1}^\alpha = \text{finite in 4 dim.}$$

All divergences cancel in d -dimensions:

$$\sum_c \int d\Phi_{n+1} \left[\frac{I_{n+1}^{c,(-2)}}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)}}{\epsilon} \right] F_{n+1}^\alpha \equiv \sum_c \mathcal{I}^c = 0$$

SU finiteness for $\alpha = 0$

$$\sigma_{SU} = \sigma_{SU}^{RR} + \sigma_{SU}^{RV} + \sigma_{SU}^{C1} \underbrace{-\mathcal{I}^{RR} - \mathcal{I}^{RV} - \mathcal{I}^{C1}}_{=0}$$

$$\begin{aligned} \sigma_{SU}^c - \mathcal{I}^c = & \int d\Phi_{n+1} \left\{ \left[\frac{I_{n+1}^{c,(-2)}}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)}}{\epsilon} + I_{n+1}^{c,(0)} \right] F_{n+1} + \left[\frac{I_n^{c,(-2)}}{\epsilon^2} + \frac{I_n^{c,(-1)}}{\epsilon} + I_n^{c,(0)} \right] F_n \right\} \\ & - \int d\Phi_{n+1} \left[\frac{I_{n+1}^{c,(-2)}}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)}}{\epsilon} \right] F_{n+1} \Theta_\alpha(\{\alpha_i\}) \end{aligned}$$

SU finiteness for $\alpha = 0$

$$\sigma_{SU} = \sigma_{SU}^{RR} + \sigma_{SU}^{RV} + \sigma_{SU}^{C1} \underbrace{-\mathcal{I}^{RR} - \mathcal{I}^{RV} - \mathcal{I}^{C1}}_{=0}$$

$$\begin{aligned} \sigma_{SU}^c - \mathcal{I}^c &= \int d\Phi_{n+1} \left\{ \left[\frac{I_{n+1}^{c,(-2)}}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)}}{\epsilon} + I_{n+1}^{c,(0)} \right] F_{n+1} + \left[\frac{I_n^{c,(-2)}}{\epsilon^2} + \frac{I_n^{c,(-1)}}{\epsilon} + I_n^{c,(0)} \right] F_n \right\} \\ &\quad - \int d\Phi_{n+1} \left[\frac{I_{n+1}^{c,(-2)}}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)}}{\epsilon} \right] F_{n+1} \Theta_\alpha(\{\alpha_i\}) \\ &= \int d\Phi_{n+1} \left[\frac{I_{n+1}^{c,(-2)} F_{n+1} + I_n^{c,(-2)} F_n}{\epsilon^2} + \frac{I_{n+1}^{c,(-1)} F_{n+1} + I_n^{c,(-1)} F_n}{\epsilon} \right] (1 - \Theta_\alpha(\{\alpha_i\})) \\ &\quad + \int d\Phi_{n+1} \left[I_{n+1}^{c,(0)} F_{n+1} + I_n^{c,(0)} F_n \right] + \int d\Phi_{n+1} \left[\frac{I_n^{c,(-2)}}{\epsilon^2} + \frac{I_n^{c,(-1)}}{\epsilon} \right] F_n \Theta_\alpha(\{\alpha_i\}) \end{aligned}$$

$$=: \underbrace{Z^c(\alpha)}_{\text{integrable, zero volume for } \alpha \rightarrow 0} + \underbrace{C^c}_{\text{no divergencies}} + \underbrace{N^c(\alpha)}_{\text{only } F_n \rightarrow \text{DU}}$$

The function $N^c(\alpha)$

Looks like slicing, but it is slicing *only* for divergences
→ no actual slicing parameter in result

Powerlog-expansion:

$$N^c(\alpha) = \sum_{k=0}^{\ell_{\max}} \ln^k(\alpha) N_k^c(\alpha)$$

- all $N_k^c(\alpha)$ regular in α
- start expression independent of $\alpha \Rightarrow$ all logs cancel
- only $N_0^c(0)$ relevant

Putting parts together:

$$\sigma_{SU} - \sum_c N_0^c(0) \text{ and } \sigma_{DU} + \sum_c N_0^c(0)$$

are finite in 4 dimension

SU contribution: $\sigma_{SU} - \sum_c N_0^c = \sum_c C^c$
original expression σ_{SU} in 4-dim
without poles, no further ϵ pole
cancellation

C++ implementation of STRIPPER

C++ implementation of STRIPPER

Features of the implementation

- General subtraction framework
 - Provides a general set of subtraction terms
 - Tree-level amplitudes are calculated automatically using a Fortran library [van Hameren '09][Bury, van Hameren '15]
 - User has to provide the 1- and 2-loop amplitudes
- Separate evaluation of coefficients of scales and PDFs
→ Cheaper calculations with several scales and PDFs
- FastNLO interface
 - Allows to produce tables for fast fits
 - FastNLO tables for $t\bar{t}$ differential distributions released this spring [Czakon, Heymes, Mitov '17]

Example: Driver program

```
// define initial state and (multiple) PDFs
InitialState initial("p","p",Ecms,Emin);
initial.include(LHAPDFsetName);
// define (multiple) scales
ScalesList scales(FixedScales(mt,mt,"muR = mt, muF = mt"));
scales.include(DynamicalScalesHT4(1.,1.));
// set up observables to be calculated
Measurement measurement;
measurement.include(TransverseMomentum({"t"},
    {{Histogram::bins(40,0.,2000.)}}});
// initialise MC generator and specify contribution to calculate
Generator generator(incoming,scales,measurement);
generator.include({{"g","g"},{"t","t~","g","g"}},2,2,0,0,false);
// run integration with 10^6 points
generator.run(1000000);
// write results
ofstream xml("ttbar.xml");
generator.measurement().print(xml);
xml.close();
```

Summary

Summary

- Minimizing the STRIPPER scheme
- alternative phase space parameterization
- new formulation of 't Hooft Veltman scheme
- tests for a class of processes:
 $pp \rightarrow t\bar{t}$, $e^+e^- \rightarrow 2, 3j$, t decay, DIS, Drell-Yan, H decays, dijets

Supplements

Factorization and subtraction terms

Single unresolved phase space:

$$\int \int_0^1 d\eta d\xi \eta^{a_1 - b_1 \epsilon} \xi^{a_2 - b_2 \epsilon}$$

Double unresolved phase space:

$$\int \int \int \int_0^1 d\eta_1 d\xi_1 d\eta_2 d\xi_2 \eta_1^{a_1 - b_1 \epsilon} \xi_1^{a_2 - b_2 \epsilon} \eta_2^{a_3 - b_3 \epsilon} \xi_2^{a_4 - b_4 \epsilon}$$

Factorized singular limits:

$$\int d\Phi_n \prod dx_i \underbrace{x_i^{-1 - b_i \epsilon}}_{\text{singular}} \tilde{\mu}(\{x_i\})$$
$$\underbrace{\prod x_i^{a_i + 1}}_{\text{regular}} \langle \mathcal{M}_{n+2} | \mathcal{M}_{n+2} \rangle F_{n+2}$$

Regularisation:

Master formula

$$x^{-1 - b\epsilon} = \underbrace{\frac{-1}{b\epsilon}}_{\text{pole term}} + \underbrace{\left[x^{-1 - b\epsilon} \right]_+}_{\text{reg. + sub.}}$$

$$\int_0^1 dx \left[x^{-1 - b\epsilon} \right]_+ f(x) = \int_0^1 \frac{f(x) - f(0)}{x^{1 + b\epsilon}}$$

Calculation of $N_0^c(0)$

For each sector/contribution:

1. extraction of $d\Phi_{n+1}$ from $d\Phi_{n+2}|_{\text{SU pole}}$ (only for RR contribution)

$$d\Phi_{n+2}|_{\text{SU pole}} = \underbrace{(d\Phi_n d^d\mu(u_1) d^d\mu(u_2))}_{d\Phi_{n+1}} \Big|_{u_2 \text{ col/soft}}$$

2. expansion in ϵ up to ϵ^{-1} (except $d\Phi_{n+1}$): $d^d\Phi_{n+1} \left(\frac{\dots}{\epsilon^2} + \frac{\dots}{\epsilon} \right)$
3. Identifying $\ln^k(\alpha)$'s from x_i integrations over Θ function

$$\Theta_\alpha(\hat{\eta}, u^0) = \Theta(\hat{\eta} - \alpha) \Theta(\hat{\xi} u_{\max}/E_{\text{norm}} - \alpha)$$

→ discard them

4. perform integration over Θ -functions of non-canceling and non-vanishing (in $\alpha \rightarrow 0$ limit) terms

common starting point for all phase spaces :

$$d\Phi_n = dQ^2 \left[\prod_{j=1}^{n_{fr}} \mu_0(r_j) \prod_{k=1}^{n_u} \mu_0(u_k) \delta_+ \left(\left(P - \sum_{j=1}^{n_{fr}} r_j - \sum_{k=1}^{n_u} u_k \right)^2 - Q^2 \right) \right] \prod_{i=1}^{n_q} \mu_{m_i}(q_i) (2\pi)^d \delta^{(d)} \left(\sum_{i=1}^{n_q} q_i - q \right)$$

$$\text{with } \mu_m(k) \equiv \frac{d^d k}{(2\pi)^d} 2\pi \delta(k^2 - m^2) \theta(k^0),$$

n : # final state particles, n_{fr} : # final state references, n_u : # additional partons
